

FACE SHIELD VISOR MODEL NO. HA5

A face shield visor is a protective device that covers the face to provide a barrier against various hazards, including splashes, droplets, sparks, and other airborne particles. It is commonly used in various industries, healthcare settings, laboratories, and construction, as well as in activities where protection of the face and eyes is essential. Face shield visors are crucial in providing an additional layer of protection beyond what standard safety glasses or goggles can offer. They are commonly used in conjunction with other personal protective equipment (PPE) to create a comprehensive safety ensemble, particularly in situations where there is a risk of facial exposure to hazards.
